

Simplestreetmap

- [Les "plugins"](#)
- [Architecture](#)
- [Todo](#)
- [Cameras](#)
- [fix psql import](#)
- [Addok](#)
- [Update tiles](#)

Les "plugins"

Un plugin serait un fichier js qui ajouterait des fonctionnalité optionnelles à simplestreetmap

Le premier serait velotoulouse.

Design (code)

- un icone et un nom à afficher dans le menu
- un objet js qui interagit avec la carte
- un composant html (dans un aside)
- un composant html (pour du fullscreen)
- un état (actif/inactif)

Architecture

Le websocket

- client -> hello {token}
- server <- "hello", {data}

actions

- add, {annotation}
- remove, {annotationId}
- hide, {annotationId}
- show, {annotationId}

Todo

Avant mise en ligne

Les annotations

- : cacher / afficher
- : éditer
 - : couleur
 - : nom
 - : horaire... (depend du calendrier, pour plus tard)
- : supprimer
- : afficher une icone selon le type d'annotation
- : au clic -> centrer la carte dessus et affichage du detail dans l'onglet correspondant
 - place
 - itinéraires
 - centrer la carte
 - afficher le detail
- ajout de sources externes (cameras)

Les itinéraires

Pour le multi modal

- afficher les horaires et les correspondances

Pour le vélo

- afficher le dénivelé (optionnel mais ca serait cool)

Général

- style des formulaire
- afficher si pas d'itinéraire
- loader qui tourne
- fichier de license dans le folder breeze
- mettre à jour le README
- partage/sauvegarde de la carte (avec un token ou dans le localStorage ?)
 - reflexion sur l'édition collaborative (quid des conflits, si partage du token)
- inverser les champs from et to avec un bouton
- clic droit -> menu -> "itinerary from/to" "add a point" "force itinerary to pass at this point"

Edition collaborative

- Ajout place
- suppr place
 - remove_annotation côté serveur
 - listener côté client
- edition place
- ajout itinéraire
- suppr itinéraire

Truc à ajouter aussi

- des infos sous la recherche
- demarrer un itinéraire d'une annotation
- clic sur un poi pour avoir des infos
- affichage temporel des annotations

- affichage du cadastre ou de l'ign ou des photo aerienne de l'ign
- sauvegarde des infos en bdd pour pouvoir partager la carte
- ajout d'annotation dessiné (rectangle, path mais fait à la main)
- simple calcul de distance à vol d'oiseau
- recherche basé sur la localisation courante
- afficher les horaires d'un bus en cliquant sur l'arrêt
- rendre responsive
- thème nuit
- traduction en français et autres langues

Truc vraiment stylé un jour

- édition collaborative !
- redirection pour acheter son billet
- gps de voiture, et affichage des bouchons (même si vive le vélo et le train)
- synchro avec un calendrier
- syncro avec un compte apple ou google (pour aider à la migration)

Truc de devops

- rebuild les tuiles une fois par mois
- rebuild de l'index de la recherche régulièrement

Cameras

Importer les données avec OSM2PGSQL

```
docker run --name postgis -e POSTGRES_PASSWORD=password -p 5432:5432 -d postgis/postgis
```

```
local cameras = osm2pgsql.define_node_table('cameras', {
  { column = 'id', sql_type = 'serial', create_only = true },
  { column = 'geom', type = 'point' },
})
```

```
local highways = osm2pgsql.define_way_table('highways', {
  { column = 'id', sql_type = 'serial', create_only = true },
  { column = 'geom', type = 'linestring' },
})
```

```
local buildings = osm2pgsql.define_area_table('buildings', {
  { column = 'id', sql_type = 'serial', create_only = true },
  { column = 'geom', type = 'polygon' },
})
```

```
function osm2pgsql.process_node(object)
  if object.tags.man_made == 'surveillance' then
    cameras:insert({
      geom = object:as_point()
    })
  end
end
```

```
function osm2pgsql.process_way(object)
  if object.is_closed and object.tags.building then
    buildings:insert({
      geom = object:as_polygon()
    })
  end
end
```

```

    })
end

if object.tags.highway then
    highways:insert({
        geom = object:as_linestring()
    })
end
end

function osm2pgsql.process_relation(object)
    if object.tags.type == 'multipolygon' and object.tags.building then
        local geom = object:as_multipolygon()

        for g in geom:geometries() do
            buildings:insert({
                geom = g,
            })
        end
    end
end

```

```
osm2pgsql -d toto -U toto -W -H localhost -O flex -S extarct_features.lua st_quentin.osm.pbf
```

Importer les données de sous-surveillance.net

<https://toulouse.sous-surveillance.net/spip.php?page=cameras&format=json&details=2&lang=fr>

```
sed -i -e 's/id_camera/node_id/g' camera.json
```

```
ogr2ogr -f "PostgreSQL" PG:"dbname=postgres user=postgres password=password host='localhost'"
"camera.json" -nln cameras -append -t_srs "EPSG:3857"
```

Utiliser postgis

Calculer une distance

```
with c1 as (select geom as g from cameras where id = 1), c2 as (select geom as g from cameras where id = 2)
select ST_Distance(c1.g, c2.g) from c1, c2 ;
```

calculer les ways qui sont à moins de 100m d'une camera

```
select c.node_id, h.way_id from cameras c left join highways h on ST_DWithin(c.geom, h.geom, 100) where c.id
= 1
```

Calculer les ways visible d'une camera

```
create view visible_streets_from_cam as
with
fields as (
select
c.node_id as camera_id,
h.way_id as street_id,
-- Changer ici pour la résolution du test d'intersection
ST_Segmentize(h.geom, 2) as street_geom,
c.geom as camera_coord
from
cameras c
left join
-- Changer ici pour la distance à la caméra
highways h on ST_DWithin(c.geom, h.geom, 100)
--where c.node_id = 9760071131
),
segments as (
select
camera_id,
street_id,
ST_MakeLine(camera_coord,p) as seg_line,
seg_id
from (

```

```
select
    fields.camera_id,
    fields.street_id,
    fields.camera_coord,
    generate_series(1, ST_NPoints(fields.street_geom)) as seg_id,
    ST_PointN(fields.street_geom, generate_series(1, ST_NPoints(fields.street_geom))) as p
from fields
) as s
),
line_of_sight as (
select
    segments(seg_id,
    segments.camera_id,
    segments.street_id,
    buildings.area_id as building_id,
    ST_Intersects(seg_line, buildings.geom) as inter
from segments
left join buildings
on ST_Intersects(seg_line, buildings.geom)
),
visible_street as (
select
    camera_id,
    street_id,
    seg_id,
    not((inter is not null) and inter) as is_visible,
    building_id
from line_of_sight
)
select
distinct
street_id,
camera_id
from visible_street
where is_visible;

select STRING_AGG(distinct(street_id::text), ',') from visible_streets_from_cam;
```

```
psql -h localhost -U postgres -c "select STRING_AGG(distinct(street_id::text), ',') from visible_streets_from_cam;"> ids.txt
```

Editer du pbf avec osmium

Convertis en format opl (format textuelle, éditabile)

```
osmium cat st_quentin.osm.pbf -f opl > st_quentin.opl
```

L'inverse

```
osmium cat st_quentin.opl -f pbf > st_quentin.osm.pbf
```

Avoir un diff

```
osmium diff st_quentin.osm.pbf merge.osm.pbf -f opl > diff.txt  
cat diff.txt | grep "^+" # ajout  
cat diff.txt | grep "^-" # suppression
```

Appliquer un fichier de changeset (attention écrase toute la relation ou tout le noeud)

```
osmium apply-changes st_quentin.osm.pbf osmChange.xml -o new.osm.pbf
```

un peu de python...

```
import re

inputFile = "st_quentin.opl"
outputFile = "output.txt"

idsToEdit =

Profils brouter

C'est pas ouf, mais pour le POC, j'ai réussi à modifier le fichier trekking en mettant:

```

assign camera = camera=yes

assign turncost = if camera then 86000 else if is_Idcr then 0
else if junction=roundabout then 0
else 90

```

Pour tester

brouter-web (c'est du statique)

<https://github.com/nrenner/brouter-web>

Tiles from postgis

```
export DATABASE_URL=postgresql://postgres:password@localhost/postgres  
~/bin/pg_tileserv_latest_linux/pg_tileserv
```

fix psql import

```
create or replace function cast_to_city_place(text) returns city_place as $$  
begin  
    return cast($1 as city_place);  
exception  
    when invalid_text_representation then  
        return 'town';  
end;  
$$ language plpgsql immutable;  
  
ALTER TABLE osm_city_point  
    ALTER COLUMN place TYPE city_place USING cast_to_city_place(place);
```

Addok

Création des données

Package (fedora)

- postgis-client
- osmctools

Commands

```
podman run --name postgis -e POSTGRES_PASSWORD=mysecretpassword -p 127.0.0.1:54321:5432 -d  
postgis/postgis
```

```
export PGPASSWORD=mysecretpassword  
psql -h 127.0.0.1 -p 54321 -Upostgres -c "CREATE EXTENSION unaccent"
```

puis

- Cloner <https://github.com/osm-fr/osmpoi4addok>
- Remplacer tout les appels à psql par `psql -h 127.0.0.1 -p 54321 -Upostgres`
- Editer `30-extract-poi.sh` et mettre `PBF_NAME` avec le bon nom
- Compiler `osmfilter` et `osmconvert` depuis les sources: <http://m.m.i24.cc/osmfilter.c> et <http://m.m.i24.cc/osmconvert.c>
- Lancer les script un par un

Sur ma tour (rizen 5), en dehors des téléchargements, midi pyrénées se fait en quelques minutes

Update tiles

Télécharger le diff

```
source env-openmaptiles/bin/activate.fish  
pyosmium-get-changes -O france.osm.pbf -o changes.osc.gz
```

Pour 1 mois et demi de diff: instantané

Importer le diff

```
make import-diff
```

Pour 1 mois et demi de diff: une 10aine de minutes

Générer les tuiles

```
make generate-changed-tiles
```
